# Pixify: Restoring Trust in the Digital Age

## A Hybrid Dual-Stream AI Approach to Deepfake Detection.

In an era flooded with digital content, the line between reality and fabrication has blurred. Deepfake technology, while impressive, poses significant threats to information integrity and public trust. Pixify directly addresses this challenge by providing a robust and reliable solution for deepfake detection.

Made with GAMMA

# The Human Eye is Obsolete

The rapid advancements in generative AI, exemplified by platforms like Midjourney and Flux, have created a landscape where AI-generated imagery is virtually indistinguishable from authentic photos. This sophisticated mimicry renders traditional human discernment ineffective, paving the way for widespread misinformation and fraud.

## The Critical Gap

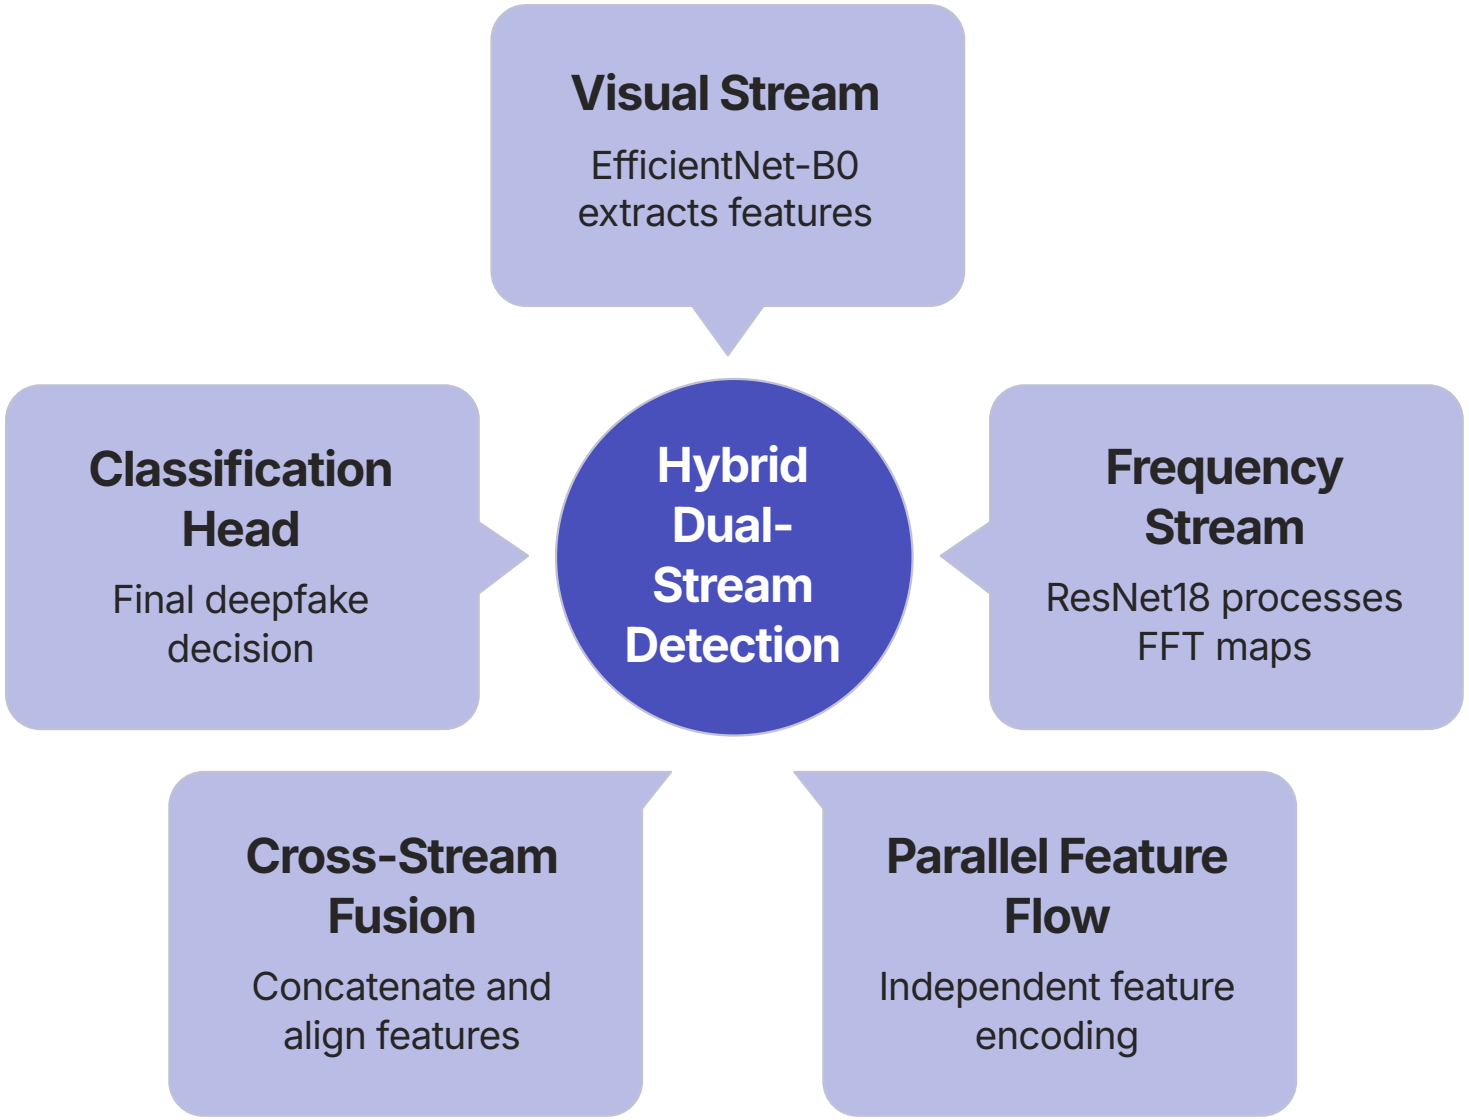
Traditional deepfake detection methods primarily rely on analyzing superficial pixel-level artifacts. However, contemporary AI models have become adept at concealing these visual inconsistencies, making such detectors increasingly ineffective. Pixify recognizes this limitation and targets a deeper, more fundamental level of analysis.

- Generative AI surpasses human detection.
- Standard detectors fail to identify hidden artifacts.
- A new approach is urgently needed.

Made with GAMMA

# Looking Beyond the Visible

Pixify's core innovation lies in its Hybrid Dual-Stream Architecture, designed to identify both overt visual cues and subtle, imperceptible mathematical signatures. This multi-faceted approach significantly enhances detection capabilities against the most advanced deepfake techniques.



Our unique architecture processes images through two distinct, yet complementary, pathways. The Visual Stream captures perceptible details, while the Frequency Stream uncovers the hidden statistical patterns that reveal AI manipulation, providing a comprehensive assessment of authenticity.

Made with GAMMA

# Unmatched Accuracy

## Validation Accuracy

# 99.50%

Our rigorous validation process demonstrates Pixify's exceptional precision in distinguishing between real and AI-generated images, setting a new benchmark for reliability in deepfake detection.

## Recall Rate

# 0.99

With a recall rate of 99%, Pixify effectively identifies nearly all instances of deepfake content, ensuring minimal false negatives and robust protection against digital deception.

# Engineered for the Real World

Our methodology combines cutting-edge datasets with advanced machine learning techniques to ensure Pixify is not only highly accurate but also resilient against evolving deepfake technologies. This rigorous engineering guarantees real-world applicability.

## Comprehensive Dataset Training

Trained on **GenImage**, a leading benchmark dataset, and fine-tuned on **Nano Banana**, which includes state-of-the-art deepfake examples, our model learns from the most diverse and challenging synthetic data.

## Robust Augmentation Strategy

We employ **MixUp Augmentation** to create interpolated training samples, enhancing the model's generalization capabilities and preventing it from overfitting to specific training patterns.

## Optimized Learning Schedule

Implementation of **Cosine Annealing** optimizes the learning rate during training, leading to faster convergence and improved model performance by navigating the loss landscape more effectively.

# Limitations & Future Scope

Acknowledging current limitations is crucial for continuous improvement. While Pixify excels in most scenarios, we have identified specific areas for future enhancement and broader application.

## Current Limitation: JPEG Compression

Extreme JPEG compression can inadvertently obscure some of the subtle artifacts our Frequency Stream detects, posing a challenge for highly degraded images.

## Phase 2: Adversarial Training

Our next phase will integrate "Adversarial Training" specifically against compression artifacts, making Pixify robust even in highly compressed image environments.

## Future Scale: Browser Extension

We envision deploying Pixify as a lightweight browser extension, providing real-time deepfake verification for news articles, social media, and other online content, empowering users to verify information at the point of consumption.

Made with GAMMA

# Ready to Deploy

### Accurate

99.5% validation accuracy across diverse datasets.

### Robust

Hybrid Dual-Stream architecture for comprehensive detection.

### Scalable

Designed for real-world deployment, starting with browser integration.

# Team Pixify

## Open for Q&A
